Nonalcoholic Fatty Liver Disease E Chart: Full Illustrated

Nonalcoholic Fatty Liver Disease

Normal liver, fatty liver and cirrhosis of the liver

Histology Normal liver

Histology Steatosis / Steatohepatitis

Histology Cirrhotic liver

Pathophysiology of fatty liver

Pharmacological treatment

References:

The most evidence of the disease is evident among the fact that it is asymptomatic in most patients, however, the rate of the general population is estimated to be 10-24% in certain populations with a prevalence of about 30% of steatosis and 10-24% of steatohepatitis according to the NASH CRN study. The long-term consequences of steatosis and steatohepatitis are not clear, although a prospective observational study has suggested a prevalence of steatosis patients who were referred to the liver because of asymptomatic steatosis of their livers, among whom different degrees of fibrosis and even cirrhosis were observed.

Most patients with asymptomatic steatosis have weight gain, 10-20% of men and 10-15% of women, and are also associated with other cardiovascular risk factors, such as hypertension, diabetes, and hyperlipidemia. The main risk factors for the disease are:

- Obesity
- Diabetes
- Hyperlipidemia
- Hypertension

All these factors are related to insulin resistance, which is the cornerstone of the problem. The disease has also been referred to the people, although concerning with some of the previously mentioned risk factors, and of age patients from children through to a later age.

Synopsis

Nonalcoholic Fatty Liver Disease e chart
Table of Contents
Nonalcoholic Fatty Liver Disease
Normal liver, fatty liver and cirrhosis of the liver
Pathophysiology of fatty liver
Pharmacological treatment
