Weapons of Mass Destruction: An Encyclopedia of Worldwide Policy, Technology, and History, 2 volumes by Jeff Larsen, James Wirtz, Eric Croddy (ABC-CLIO) (1-85109-495-4 On-line e-book, see publisher) The first accessible reference to cover the history, context, current issues, and key concepts surrounding biological, chemical, and nuclear weapons. The United States has conducted some 900 atomic tests since 1945 and has stockpiled enough smallpox vaccine to inoculate most of the U.S. population. The topic of weapons of mass destruction is perhaps the most controversial subject of our time. Policy debates require understanding of key issues, concepts, and events. A collection of information on everything from aerosols to zones of peace, these two volumes cover historical background, technology, and strategic implications of biological, chemical, and nuclear weapons, thus providing facts, terms, and context needed to participate in contemporary policy debate. This encyclopedia is the only comprehensive reference dedicated to the three types of

weapons of mass destruction. With over 500 entries arranged alphabetically, volume one covers biological and chemical weapons, while volume two focuses on nuclear weapons. Experts from eight countries cover issues related to these weapons, policies, strategies, technologies, delivery vehicles, arms control concepts, treaties, and key historical figures and locations. Entries are written to make difficult concepts easy to understand by cutting through military and scientific jargon. Students, lay readers, scientists, and government policy makers are provided with the broad range of information needed to place today's policy discussions in proper strategic or historical context.
